Trauma-informed Social-Emotional Learning (SEL)

This document is part of a full toolkit for educators. Find this toolkit and other educator resources on our website by visiting www.transformingeducation.org.

Trauma-informed SEL is an approach to fostering youths’ social-emotional development that seeks to create a safe and reliable environment where students who have experienced adversities and trauma feel supported, are welcome to explore their strengths and identities, exercise their agency, can develop meaningful, positive relationships with adults and peers in their learning community, and have access to the mental health supports they need.

Educators using trauma-informed SEL practices recognize all their students’ strengths, assets, and contributions, and leverage opportunities to infuse positive experiences in the classroom to support every child’s ability to reach their own potential. Educators also work to develop and model their own social-emotional skills, use self-care practices that allow them to be supportive adults for their students, and actively engage mental health supports as their need for them arises.

Key Trauma-informed SEL Practices

Create predictable routines.
Help children who have experienced trauma adapt to transitions a little easier so that they feel safe and ready to learn.

Build strong & supportive relationships.
Strong relationships can provide the responsiveness, scaffolding, and protection that can support children who are feeling the effects of traumatic events.

Empower students’ agency.
Help your students feel seen, heard, and empowered. Be responsive to their needs. Find ways to support their goals and efforts to build their self-efficacy and exercise their agency.

Support the development of self-regulation skills.
Actively building executive functioning and self-regulation skills can help youth cope with, adapt to, and offset effects of adversities. Practice and develop your own self-regulation. Acknowledge students’ capacity and resilience, and celebrate how resourceful they are.

Provide opportunities to explore individual and community identities.
Help students strengthen and explore their own identities and explore the perspectives of others through various activities that promote agency and civic engagement. Encourage participation in local community traditions.
### More about ACEs and Trauma.

Trauma is an experience of one or more overwhelmingly stressful adverse events (or ACEs) where one’s ability to cope is dramatically undermined. The event can be witnessed or experienced directly and can cause the person to have an extreme psychological and/or physiological response due to feeling terror and/or perceived helplessness.

Symptoms of trauma vary and can present differently at different times. Below are a few common examples by age group.

- SAMHSA (n.d.) Understanding childhood traumas; Safe Place to Learn (n.d.) Common Symptoms of Trauma by School Age Group
Important Considerations

- Children of different age levels can present with a range of symptoms and expressions of trauma.
- Some symptoms are more common in some age groups than others, but they can overlap across groups.
- Children and youth might present with these behaviors for other reasons not related to a traumatic event (for example, irritability and inattention because they are sick). It is always important to find out more information if you suspect that a student is responding to trauma.
- Children are not always aware of “trauma reminders” or triggers - events, situations, places, sensations, and even people that they consciously or unconsciously connect to a traumatic event. If a child’s symptoms are the result of trauma, they can experience “trauma reminders” that may cause them to behave a certain way with no obvious trigger in the environment.
